

Vulnerability Management

Every day hackers uncover potential weaknesses in an IT environment – in 2020 alone, over 18,000 vulnerabilities were published. Many of these get used by attackers within days, before IT units have started responding with patching. Without a vulnerability testing tool in place, you won't be aware of new gaps that may leave your organization open to cyber attacks or which systems are hackable.

At Arco IT, we pride ourselves on finding and fixing the holes in your organization's network security that others may have missed. We understand that even the strongest architecture weakens over time and new vulnerabilities are bound to occur. Our aim is to expose and eliminate those gaps before an attacker can exploit them to breach your IT infrastructure.

We help you prevent cyber attacks by scanning your IT assets for vulnerabilities, prioritizing them and coordinating the best response to eradicate them.

A 3-STEP PROCESS

To manage your vulnerabilities, we employ a best-in-class testing and assessment platform to regularly take a comprehensive snapshot of your vulnerabilities.

1. SET-UP

Once deployed in your IT environment, the scanning appliance discovers all the assets composing it.

2. SCAN

Scans are performed one-off or periodically on the discovered assets.

3. SECURE

Findings are manually reviewed, prioritized based on your particular organizational situation. Then we help coordinate the actions to resolve them.

WHAT YOU CAN EXPECT

Your business relies on a solid foundation, without cracks or weaknesses. We'll help lay that foundation, as well as regularly reinforce it to ensure your IT infrastructure is strong enough to deter attackers. With automated and continuous vulnerability scans, you can be confident that your security standards and patch management process slam the door on malware attacks.

YOU BENEFIT FROM:

- ✓ A fully-automated solution with more than 25 integrated security testing tools for continuous coverage against present or future threats
- ✓ Knowledge of system weaknesses so that you can keep these under closer supervision and take action more quickly
- ✓ Quick, reliable and easily visualized findings
- ✓ Full support and coordination from trained experts to swiftly resolve the vulnerabilities
